

Practical No 01

Aim :- ER modeling and normalization decide a case study related to real time application in group 2-3 student and form a problem statement for application to be developed propose a conceptual design using ER features using tools like GRD plus, ER (win etc)

Objective :- To learn or perform a entity relationship diagram according to problem statement.

Hardware Requirement :- Ubuntu Any CPU 32, IS 2SS MB Rom & 3GB HDD

Software Requirement :- Ubuntu 20.4 LTS, MySQL.

Theory :- Data model :- The data model describes the structure of a database. It is a collection of Conceptual tools for describing data relationship and consistency constraints and various type of data model.

1> object based logical model

2> Record based logical model

3> Physical model

Teacher's Signature

* Entity Relationship model :- The entity relationship data model perceives the real world as consisting of basic objects called entities and relationship among these objects. It was developed to facilitate design by allowing specification of an enterprise schema which represent the overall logical structure of database.

* Features of ER-model :-

1> Entity relationship model is a high level conceptual model.

2> It allows us to describe the data involved in a real world enterprise in terms of objects and their relationships.

3> It is widely used to develop an initial design of database.

4> It describes data as a collection of entities relationship and attributes.

* Basic Concepts :- The E-R data model employs three basic notation :-
① entity sets
② relationship
③ attributes.

① Entity Set :- An entity is a thing or object in the real world that is distinguishable from all other object for example each person in an enterprise is an entity has a set properties and the value from some set of properties. may uniquely identify an entity. Book is entity and its properties (called as attributes) bookcode booktitle, price etc.

② Attributes :- An entity is represented by a set of attributes are descriptive properties possessed by each member of an entity set. e.g. customer is a entity and its attributes are customer id, customer name etc.
- Following are the attribute type.

a) Simple and Composite attribute :- Simple attributes are the attributes can't divided into sub parts e.g. customer id etc.

b) Single-valued & multi-valued Attribute :- The attribute having unique value is single-valued attribute e.g. empno, customer id etc.

c> Derived Attribute :- The values for this type of attribute can be derived from the values of existing attributes e.g. age which can be derived from current date.

d> Null attribute :- The attribute value which is not known to user is called null valued attribute.

* Relationship sets :- A relationship is an association among several entities. A relationship set is a set of relationship of the same type. Formally it is a relation on $n > 2$ entity sets. If E_1, E_2, \dots, E_n are entity sets then a relationship set R is a subset of $\{(e_1, e_2, \dots, e_n) \mid e_1 \in E_1, e_2 \in E_2, \dots, e_n \in E_n\}$ where (e_1, e_2, \dots, e_n) is relationship e.g.

* mapping cardinalities :- mapping cardinalities or cardinalities ratio express the number of entities to which another entity can be associated. A relationship mapping cardinalities are most useful in describing binary relationship sets.

① one to one :- An entity in A is associated with most one entity in B and one entity in B is associated with at most one entity in A.

eg. relationship between college & principal.

② one two many An entity in A associated with any number of entities in B An entity in B is associated with at the most one entity in A.

e.g. Relationship between dept and faculty

④ many to many :- Entities in A & B are associated with any number of entities from each other.

* keys :-

① super key :- A super key is a set of one or more attribute that taken collectively allow us to identify uniquely an entity in the entity set.

Teacher's Signature

② Candidate Key : — In a relation R a Candidate key for R is subset of the set of attributes of R which have the following properties.

1) Uniqueness : — No two distinct tuples in R have the same values for the Candidate key.

2) Irreducibility : — No proper subset of the Candidate key has the uniqueness property that is the Candidate key e.g. (Cname, IDno)

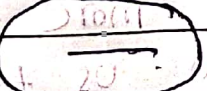

③ primary key : — The primary key is the Candidate key that is chosen by the database designer as the principal means of identifying entities within an entity set the remaining candidate keys if any are called Alternate key the logical structure of database using ER-model graphically with the help of on E-R-diagram.

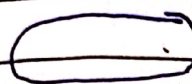

Symbols use ER-diagram.

 — Entity

 — Attribute

 — Weak entity

 — Key Attribute

 - Attribute

 - Relationship

 - multivalued attribute

 - Identifying Relationship.

 - Composite Attribute

 One to one

 one to many

 one to many

 total participation

 partial participation

Conclusion : → Hence, we studied about the data model, Basic concepts of ER - Model & symbols used in ER - diagram etc.
